TEST COMMENTS:

This typically outstanding corn location has definitely seen its challenges this year. Planted in very nice soil conditions with quick and even emergence, this location was looking great early season. Turning dry and missing some rain during critical reproductive growth stages held the full potential of these hybrids back. Pollination went well, and ear development was solid. However, heavy disease pressure in August matured the plants quicker than ideal. A large wind and hail event towards the end of the month severely damaged many hybrids, causing significant lodging. In some cases, the plants were completely flattened, which made harvest challenging. Despite this season's challenges, the plot still did very well.
