TEST COMMENTS:

This conventional location was planted in mid-May with good populations and great weed control. The plants in the early-season test, favored by the season-long rainfall, were all intact and showed good plant health. Some slight green snapping occurred on one pass of the test. The full-season hybrids had underdeveloped ears with very small kernels, and several hybrids had lost their top of the stalk above the ear. The moistures were nearly identical between the two sets of hybrids, indicating that the lack of rainfall in August and September encouraged the full-season hybrids to DIE down instead of dry down. The yields were good for what this site went through.
